System calls are pre-defined system functions written in high level programming language. Operating Systems can communicate with hardware through the system calls. But it may take lots of instructions to finish a system call.

* Dalvik Virtual Machine

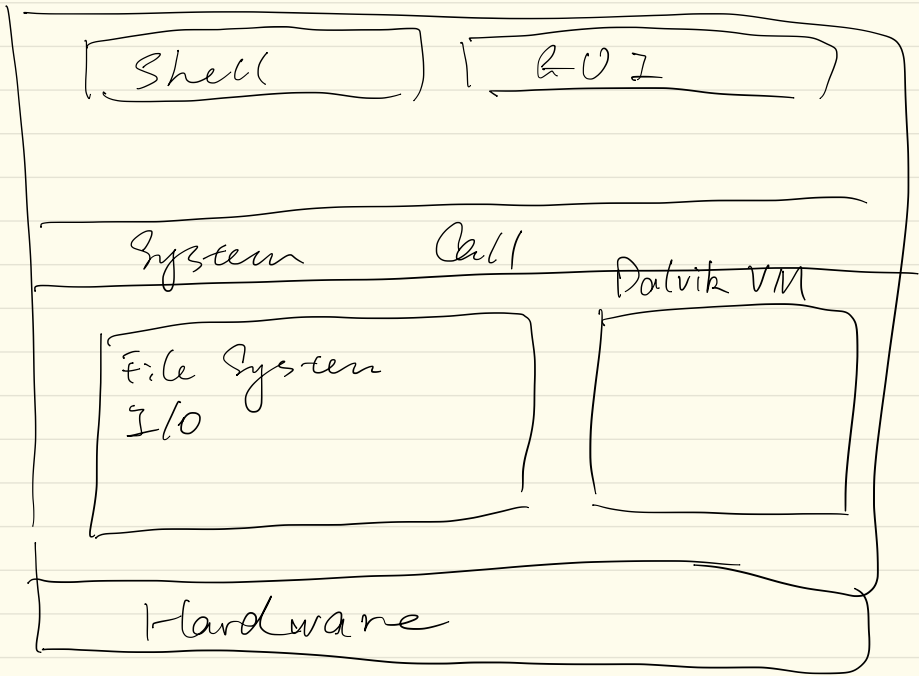

1. System calls are services support to Operating System. It allow OS communicate^{control.} with hardware
- Resource Allocate / I/O System / File System

2. MS-DOS

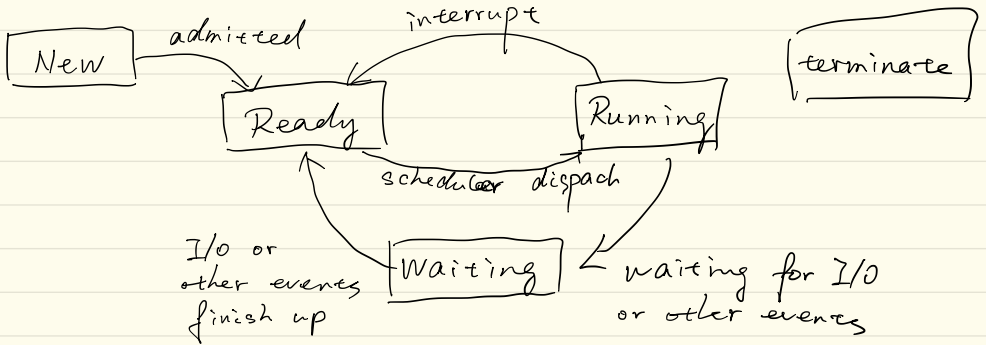

3.

1.

in Mobile :

iOS : one foreground process
multiple background processes

Android : one foreground process
background services

3.

process state
process number
program counter
address
limited memories
relative files
